

FPLD Picture Gallery

FPLD female front view (noticeable lack of fat in arms and legs)

FPLD female side view (note lack of fat in legs and arms, umbilical hernia, excess fat in face, neck, back and stomach)

Acanthosis Nigricans causing velvety light brown pigmentation due to elevated levels of insulin 'spilling over' into the skin.

Loss of subcutaneous fat gives the legs a muscular appearance, veins appear more prominent.

Excess supraclavicular fat (fat above the clavicle) and a round face gives a 'cushingoid' appearance.

Males display a more sporty, muscular appearance but with fat still accumulating under the chin.

In women, lack of fat in the buttocks (gluteal regions) is striking and they complain of “no-hips” or “flat hips”.

Father and daughter excess fat in the hands.

Prominent fat excess in shoulders and back.
